

You are already paying for this. You are just paying it to inefficiency.

Thirteen modules. One capture layer. Paid only out of savings AFFIN itself has verified.

THE COMMERCIAL MODEL · GAIN-SHARE

RM 0 until it works.

No verified saving. No fee. Ever.

Zero financial risk to the bank. AFFIN commits people and data — not budget — until a saving has been booked.

00 » 01 » 02 AFFIN can stop after any phase.

00 Diagnostic — at OUR cost

AFFIN pays RM 0. 4–6 weeks. Delivers a jointly-signed Verified Savings Baseline.

01 90-day pilot — one capped fee

Credited back in full against Phase 02. Nothing else is invoiced.

02 Scale — paid only from savings

Verified by AFFIN's own finance team. No verified saving in a period, no fee for that period.

● DAY-90 GUARANTEE If AFFIN's own measurement shows verified savings below the pilot cost, we absorb the shortfall.

TRACK A · EIGHT EXISTING COST LINES

reduction band on the bank's current spend

A1	Building inspection manual rope/ladder inspection, patchy records	50–60%	A5	Security & guarding night shifts are a third of the bill	20–30%
A2	Branch energy HVAC running into empty nights	18–25%	A6	ATM operations checked twice a day; skimmers invisible to that	~60%
A3	Maintenance breakdowns cost 3–5x planned work	20–25%	A7	Collateral valuation 3–5 days and a travel bill per revaluation	30–40%
A4	Branch network overlapping catchments, prime rent on quiet sites	10–15%	A8	Insurance premium priced on industry average — no data to argue with	8–15%

A8 works by feeding the risk data captured in A1–A7 to the insurer as negotiating evidence — the bank stops being priced on an average it cannot dispute.

TRACK B · CREDIT LOSS

- B1 **Construction loan early warning**
stall or diversion surfaced 3–6 months earlier
- B2 **NPL disposal**
- B3 **Collateral monitoring**
- B4 **Capital optimisation**
- B5 **Fraud detection**

All five run on the same capture layer as Track A.

WHY THIRTEEN COSTS LESS THAN THREE

One flight. Thirteen returns.

The same drone flight that inspects a building for A1 also revalues collateral for A7, verifies progress for B1 and feeds monitoring for B3.

Thirteen modules share one capture layer — drone, satellite, IoT, fixed camera, BIM/GIS — and one technology base: digital twin, GIS, AI, big-data risk control, e-signature/PKI.

The 13th module costs a fraction of the 1st — which is why buying it piecemeal from three vendors costs more and delivers less.

DELIVERY TECHNOLOGY PARTNER

Yunxingyu BEIJING STOCK EXCHANGE : 873806
北京云星宇交通科技股份有限公司

28 years in IT · 400+ registered IP rights · 119 software copyrights
RMB 3.0bn of contracts across 100+ projects in 30 provinces
12 national / provincial awards

The ask four decisions, none of them a budget decision

1
Approve the diagnostic
It costs AFFIN nothing and takes 4–6 weeks.

2
Half a day in one room
Operations, Finance, Corporate Banking, Credit, Risk, Technology.

3
Name three owners
Executive sponsor, B1 business owner, risk owner.

4
Fix the hurdle in writing
Benefit-to-Cost hurdle and the Day-90 measurement method.

The only thing AFFIN risks by starting is finding out how much it has been overpaying.

Evidence discipline: reduction bands and external case results are the delivery partner's model and partner-provided data pending independent verification, shown for planning and capability reference only. All ringgit figures are computed from AFFIN's own inputs. No result is presented as achieved until measured and confirmed by AFFIN. Commercial terms are indicative and subject to written agreement.
